Contribute with GitLab

- Git
- GitLab
- A contribution workflow

GitLab

- Hosts Git repositories
- Adds collaborative & CI features
- Very similar to GitHub
- Open source

GitLab

- GitLab.com (free)
- Community Edition (free)
- Enterprise Edition (paying)

Contribution workflow

- Set of common rules and good practices
- Define one that everyone agree with
- Identify problems and questions before merging

Concepts

9

Project

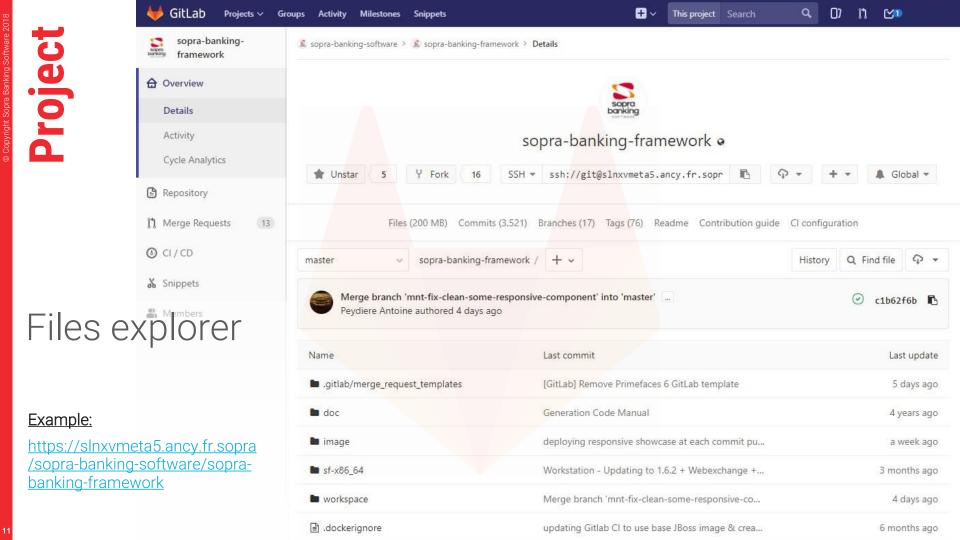

- Git repository + collaborative data
- Private, internal or public
- Owned by a group or a user

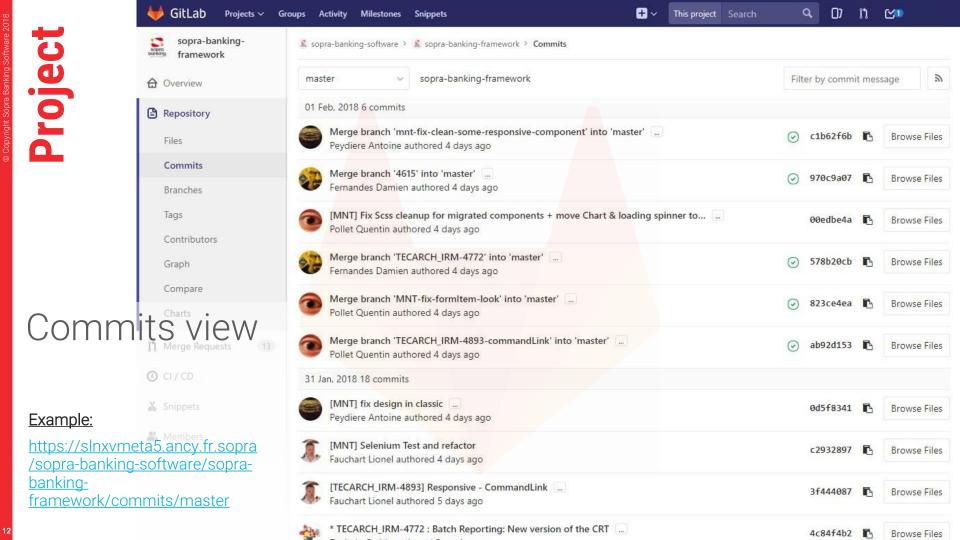

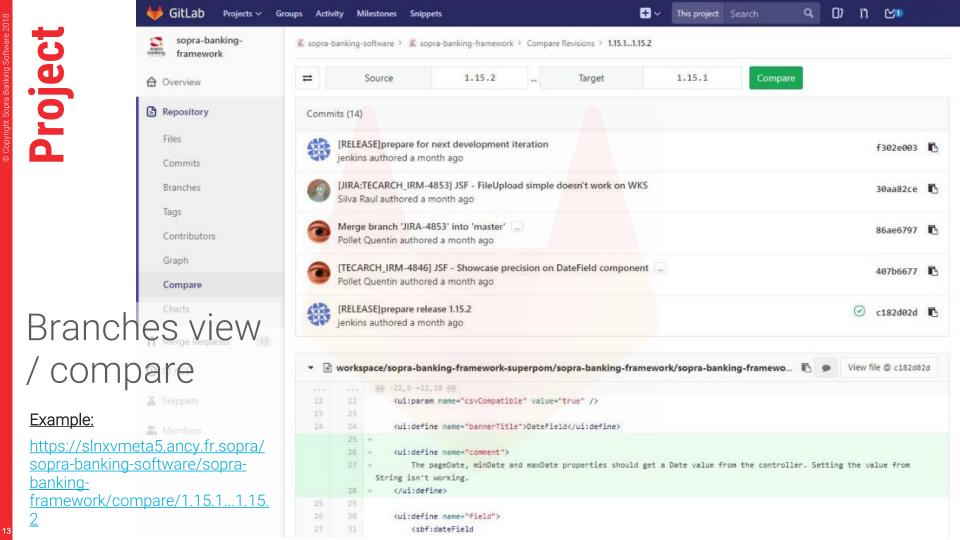

sopra-banking-software / sopra-banking-framework

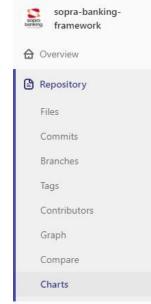

Tournie Stephane / sopra-banking-framework

Statistics Merge Requests Of CI/CD ** Snippets

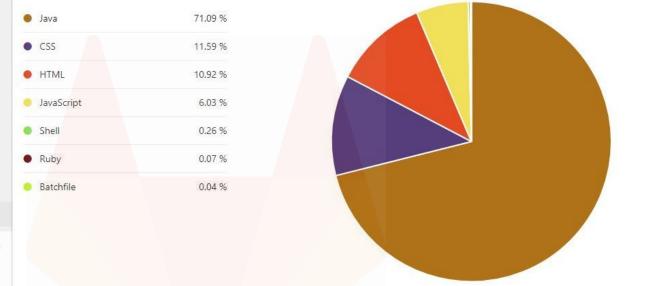

Example:

https://slnxvmeta5.ancy.fr.sopra/ sopra-banking-software/soprabankingframework/graphs/1.15.2/charts

Members

Programming languages used in this repository

Commit statistics for 1.15.2 Sep 23 - Jan 03

- Total: 2000 commits
- Average per day: 1 commits
- Authors: 23

Commits per day of month

14

CI configuration

- .gitlab-ci.yml
 - Pipeline of jobs

- sopra-banking-software > 🐒 sopra-banking-framework > Pipelines > #2482
- Pipeline #2482 triggered 4 days ago by Fernandes Damien (passed
- Triggered by commit push

Status on Merge Request

Merge branch 'TECARCH_IRM-4772' into 'master'

[TECARCH IRM-4772] A new version of the CRT is available, CRT V2.

See merge request !304

- 4 jobs from master in 4 minutes 43 seconds (queued for 2 seconds)
- 578b20cb ... ₽

CONTRIBUTING.md

Sopra Banking Framework Contributing Guide

Basic steps

To contribute to Sopra Banking Framework first ask your GitLab admin to give you permission on the project, fork the origin repository to your own GitLab account, clone your fork commit your work on topic branches, and make Merge Requests.

Here are the steps in detail:

Example:

https://slnxvmeta5.anc

<u>y.fr.sopra/sopra-</u> banking-

software/sopra-

banking-

<u>framework/blob/maste</u> r/CONTRIBUTING.md

2. Clone the original repository. This creates and populates a directory in your local file system.

git clone https://slnxvmeta5.ancy.fr.sopra/sopra-banking-software/sopra-banking-framework.git (in Eclipse: left click in Project Explorer then Import > Projects from Git > Clone URI)

3. Add the remote

1. Fork the project. This creates a new project in your own GitLab account with a fork relationship to the original repository.

git remote add <your-username> https://slnxvmeta5.ancy.fr.sopra/<your-username>/sopra-banking-framework.git
(in Eclipse: in Git perspective, expand the original repository and left click on Remotes > Create Remote...)

4. Get the latest files from the origin repository.

git fetch origin
(in Eclipse: left click on your project then Team > Pull)

5. Create a new topic branch to contain your features, changes, or fixes using the git checkout -b <topic-branch-name> origin/master command. For example:

git checkout -b EVOTA-123 origin/master

Concepts

Fork

- Copy of an existing repository
- New project on another group/user workspace
- Link to origin project

Global ▼

Add License

WIP: EVOTA-3870: Middleware controller - data access Cobol / New Connector

What does this Merge Request implement or fix?

Middleware controller - data access Cobol / Only New Connector with JCA EVOTA-3870

Are there points in the code the reviewer needs to double check?

- · Dependencies in pom.xml
- Throwable errors in connector

Does this MR meet the acceptance criteria?

- Documentation created/updated (if relevant)
- Tests added for this feature and passing (Tests can be done in SBFSA)
- ☐ Branch has no merge conflicts with master (if it does rebase it please)
- Squashed related commits together

Pipeline #212 passed for 7d3aba93.

Request to merge dfernandes: EVOTA-3870 into master (71 commits behind)

Check out branch

Download as

This merge request is currently a Work In Progress

When this merge request is ready, remove the WIP: prefix from the title to allow it to be merged.

Discussion 3 Commits 2 Pipelines 2 Builds 1

1/1 discussion resolved

Fernandes Damien @dfernandes commented 3 weeks ago

Merge Request

- Request to integrate changes in main repository/branch
- Related to a (JIRA) Story
- From a branch in same project or in a fork
- Discussed, reviewed, (reworked,) validated and... merged

Merge Request

- One Merge Request ≠ one commit
- Usual target branch is origin/master
- Both human and automated validation

Code review

Filipa Lacerda @filipa started a discussion on the diff about an hour ago Last updated by Filipa Lacerda about an hour ago

- Manual / read code
- Validate Merge Request made by another developer
- Any relevant discussion, link, quote, inline, ...

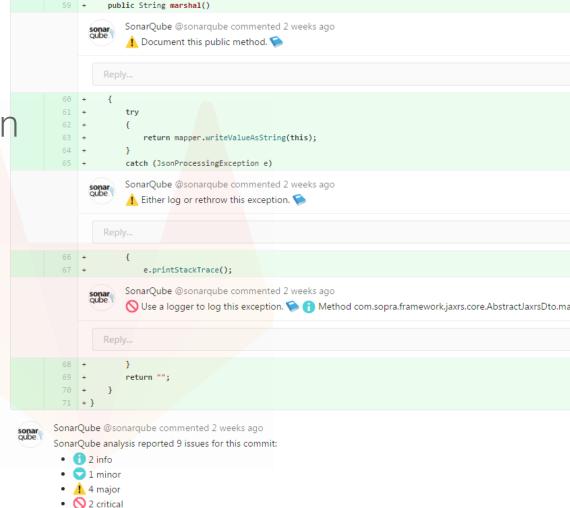

Filipa Lacerda @filipa marked the task Squashed related commits together as completed about an hour ago

Filipa Lacerda @filipa commented about an hour ago @ayufan can you please review this?

Automated validation

- Compile & unit tests
- Sonar analysis
- Fail if error
- Notify author

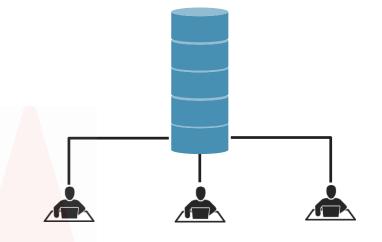

Look at the inline comments inserted above to review related issues.

Centralized flow

- Central repository
- All changes committed to origin/master
- SVN-like

Feature branch flow

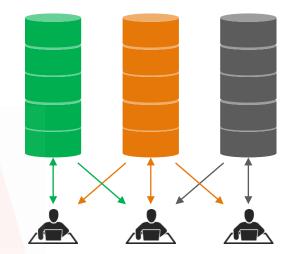

- Isolated branch per feature/Story
- Work on a particular feature without disturbing the main codebase
- Merge Requests possible (code review, discussion)
- Feature Branch (Martin Fowler) https://martinfowler.com/bliki/FeatureBranch.html

27

Forking flow

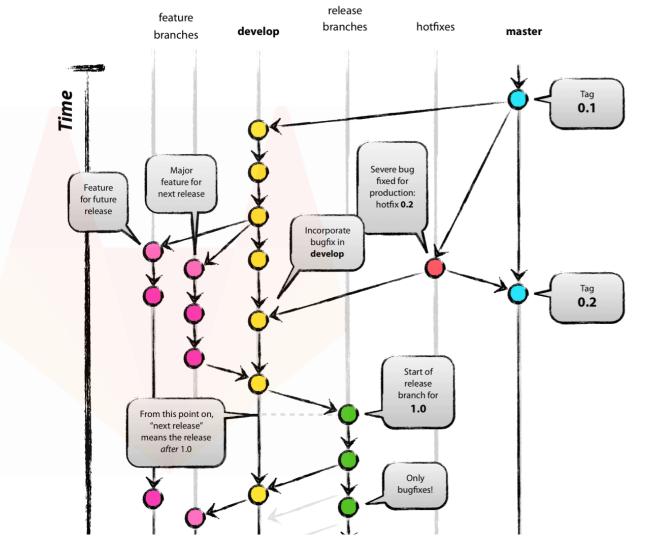

- No push to central repository
- Every developer has a fork of the original repository
- So each developer has two Git repositories
- Only the project maintainer can push to the original repository
- Original repository evolves through merge requests

Git flow-

http://nvie.com/posts/asuccessful-git-branching-model/

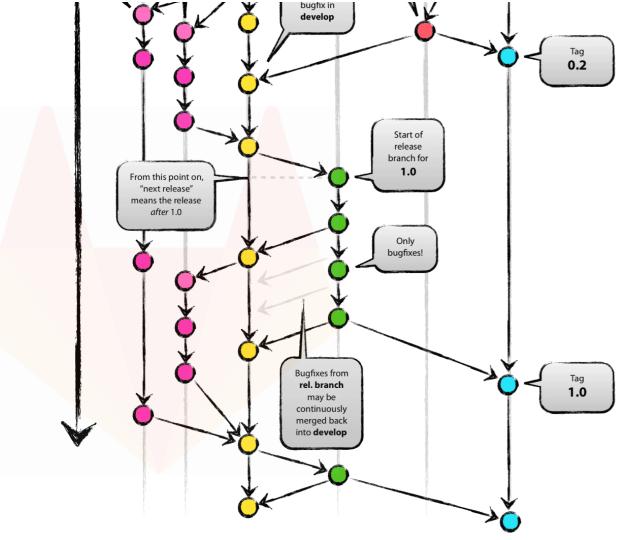

Too complex

Git flow-

http://nvie.com/posts/asuccessful-git-branching-model/

Too complex

Too complex

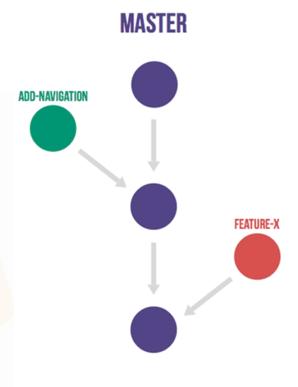

Git flow - http://nvie.com/posts/a-successful-git-branching-model/

- Feature branch flow + specific roles to different branches
- Strict branching model around the project release
- branches:
 - develop = integration branch for features
 - feature branches = one branch per feature
 - release branches
 - master = release history
 - hotfixes = quick patches for production releases

31

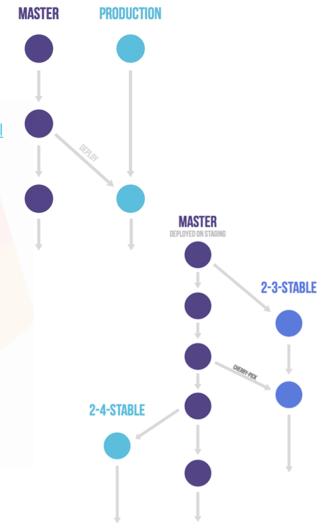

GitHub flow - http://scottchacon.com/2011/08/31/github-flow.html

- Back to basics
- Any commit must be self-sufficient (rollback possible)
- Open a Pull Request at any time (ready / need help / need feedback)
- Deploy immediately after your Pull Request get reviewed & merged
- "Anything in the master branch is always deployable"

GitLab flow - https://docs.gitlab.com/ce/workflow/gitlab_flow.html

- Add practical rules to the GitHub flow
 - protect long-lived branches (usually master)
 - commit often
 - test before merging
 - squash commits with rebase
 - link issues to Merge Requests
 - request approvals on Merge Requests
 - prevent merge commits, but don't eliminate them
 - remove merged branch

Proposed workflow

- This workflow is explained here
 https://documentation-sa2.apps.sodigital.io/development-workflow/
- origin/master protected in the project repository
- Feature branch per (JIRA) Story
- Merge Request with human & automated validation
- Commit & development rules

Copyright Sopra Banking Software

Proposed workflow

Protected branch (origin/master)

- No commits are allowed in origin/master
 Modify origin/master only through Merge Requests
- "Anything in the master branch is always deployable"
- Any change must be double checked before merging
- Any commit can be rolled back
- Protect other branches on origin ?

36

Feature branch per Story

- One JIRA Story = one Git branch
- Work / discussion / team isolation
- Naming convention
- Source of Merge Requests
- Feature branches can be shared between several devs

Merge Request with validation

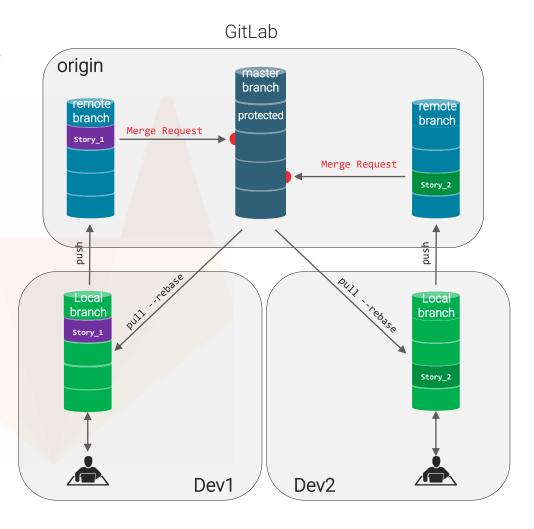

- Create Merge Request once you need:
 - help
 - feedback
 - validation
- A Merge Request is a living process
- Code review + CI build + Sonar analysis before merging

Commit & development rules

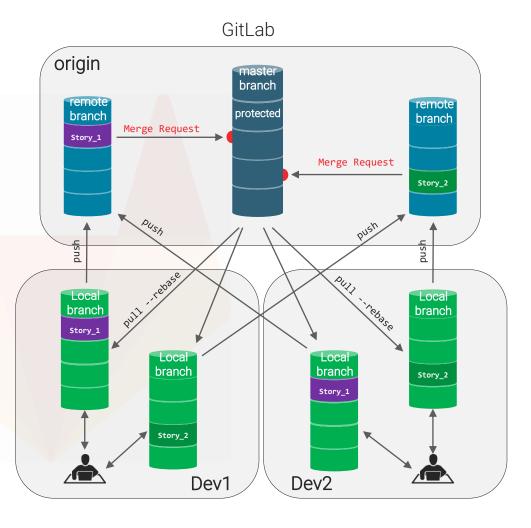

- Any commit must be « buildable » & « revertable »
- Merge Requests description must follow a Template
- MRs must be approved before merging (all discussions marked resolved)
- Commits in MRs that are related must be squashed before merging

Summary

- Branch per Story (Story-...)
- Branches created locally
- Common rules in Merge Request template
- Merge Request OK when:
 - Rules OK
 - Build OK
 - Sonar OK
 - 2 approvals

Feature branches can be shared between several developers
